Software Architecture Document

Ontology Management Cell 1.0
Abstract:

This is a software architecture document for Ontology Management (ONT) cell. It identifies and explains important architectural elements. This document will serve the needs of stakeholders to understand system concepts and give a brief summary of the use of the ONT message format.

1. Overview

The Ontology Management cell (ONT) is an i2b2 Hive Core cell. This cell manages i2b2 vocabulary definitions and contains concepts and information about relationships between concepts for the entire hive. It is accessed by other cells to give semantic meaning to data.

Vocabularies in the ONT cell are organized in hierarchical structures that represent the relationships between terms. The top levels in the hierarchy are called the ‘parents’ or ‘roots’, with the lower levels being their ‘children’. Elements occurring on the same level are known as ‘siblings’. A level in a hierarchy is sometimes referred to as a ‘node’, and a group of related data is called a ‘category’.

A category is defined as a set of data for which there is a common rule or rules for querying against the Clinical Research Chart (CRC). A category is usually represented visually as a table of terms. An example of a category is the Diagnoses category shown in the diagram below, which consists of a table of diagnostic terms and uses a single rule to build all diagnostic queries.
Vocabularies in the ONT cell may originate as code from different sources. The ONT cell distinguishes these codes from one another by prepending a unique prefix to each code. Each distinct vocabulary and their associated codes is called a scheme.

1.1. ONT Definitions, Acronyms and Abbreviations

1.1.1 Vocabulary Data Object (VDO)
This object holds vocabulary definitions and information about the relationships between concepts.

1.1.1 Scheme
Each distinct vocabulary and their associated codes is called a scheme. A distinction is made between codes from different sources by prepending a unique prefix to each code.

1.2 Roles

The primary roles/participants in the ONT system are as follows:

- User – Create queries and access them only if he/she is owner to of the query.
- Manager – Create queries and can access queries created by different users within the project.

1.3 Security

Users may access ONT with a user-id and password combination, which is authorized through the Project Management Cell. The implementation detail of Project Management Cell is considered out-of scope to this document.

1.4 Scope of the system

Some other participants, currently outside the scope of ONT are:

- Project Management Cell
1.5 Assumptions/Constraints

- The Ontology metadata database shall not contain protected health information.

1.6 Technical Platform

The technology used to build the product is as follows

- Java 2 Standard Edition 5.0 version 11
- Oracle Server 10g database
- Xerces2 XML parser
- JBoss Application server version 4.0.3SP1
- Spring Web Framework 2.0
- Axis2 v1.1 web service (SOAP/REST messaging)

1.6.1 Transaction

The ONT system is transactional, leveraging the transaction management model of the J2EE platform.

1.6.2 Security

The application must implement basic security behaviors:

- Authentication: Authenticate using at least a user name and a password
- Authorization: User may only access categories that they are allowed to by role
- Confidentiality: Sensitive data must be encrypted
- Data integrity: Data sent across the network cannot be modified by a tier
- Auditing: In the later releases we may implement logging of sensitive actions

1.6.3 Persistence

This application utilizes JDBC calls to retrieve persisted data.

1.6.4 Reliability/Availability

The Reliability/Availability will be addressed through the J2EE platform. Targeted availability is 16/7: 16 hours a day, 7 days a week. The time left (8 hours) is reserved for any maintenance activities.
1.6.5 Performance
The user authentication with project management cell must be under 1 second.

2. Use Case
The diagram below depicts common use cases a user may perform with the ONT cell.

2.1 Operations
The ONT service is designed as a collection of operations, or use cases:

get_categories: returns a list of categories available for a given user. These categories are displayed in a tree format. The top level of the tree consists of all the categories a particular user has permission to see as determined by his/her role.

get_children: expands any level of a vocabulary category, providing information about its children, for a given user.

get_schemes: returns a list of schemes available in the system. This operation provides information about the different kinds of coding systems that exist.

get_name_info: returns information needed about all nodes related to a given search keyword or name.
get_code_info: returns information about all nodes related to a particular code.

get_term_info: returns information about a particular node.

3. Architecture Description

This section provides a description of the architecture as multiple views. Each view conveys the different attributes of the architecture.

1) Components and Connector View
   a) Client-Server Style

2) Module View
   a) Decomposition Style
   b) Uses Style

3) Data View

4) Deployment View

3.1 Components and Connector View

A Components and Connector view represents the runtime instances and the protocols of connection between the instances. The connectors represent the properties such as concurrency, protocols and information flows. Following diagram represents the Components and Connector view for the multi-user installation. As seen below, component instances are shown in more detail with specific connectors drawn in different notations.
3.1.1. Client-Server Style

The ONT system is represented using the C&C Client-Server view.

3.1.1.1 Primary Presentation

3.1.1.2 Design Rationale, Constraints

N-tier Architecture

The client-server style depicts an n-tier architecture that separates the presentation layer from business logic and data access layer.
3.2 Module View type

The module view shows how the system is decomposed into implementation units and how the functionality is allocated to these units. The layers show how modules are encapsulated and structured. The layers represent the “allowed-to-use” relation.

The following sections describe the module view using Decomposition and Uses Styles.

3.2.1 Decomposition Style

The “Decomposition” style presents system functionality in terms of manageable work pieces. It identifies modules and breaks them down into sub-modules and so on, until a desired level of granularity is achieved.

3.2.1.1 Primary Presentation

<table>
<thead>
<tr>

</table>

3.2.1.3 Context Diagram
3.2.2 Uses Style

The “Uses” style shows the relationships between modules and sub-modules. This view is very helpful for implementing, integrating and testing the system.

3.3 Mappings of Styles

The following table is a mapping between the elements in the Component & Connector Client-Server view shown in section 3.1.1, and the Modules Decomposition and Uses views shown in sections 3.2.1 and 3.2.2.

The relationship shown is *is-implemented-by*, i.e. the elements from the C&C view shown at the top of the table are implemented by any selected elements from the Modules views, denoted by an “X” in the corresponding cell.

<table>

4. Data View

4.1 Data Elements

The key data elements related to the ONT system are:

A Vocabulary Data Object (VDO) is the primary means of communication between a client requesting ONT services and the ONT server. Responses contain a collection of Concepts generated by the query represented in the client’s request.

4.2 Schemas

The following schemas provide data used by the ONT system:

<table>
<thead>
<tr>
<th>Metadata</th>
<th>Table_access</th>
<th>Schemes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>

</tr>
</tbody>
</table>
A Concept is a vocabulary data object encapsulation of the Metadata schema. It is the primary object used to pass vocabulary information to the requesting client.

The Table_access schema expands upon the VDO, containing security information for the root level vocabulary nodes. It is used primarily to provide a list of categories available for a given user based upon his/her project and role.

The Scheme schema contains the unique prefixes obtained by different source codes. For example, codes from the National Drug Code are prepended with the ‘NDC’ prefix, while codes from the United Medical Language System are prepended with the ‘UMLS’ prefix. This schema contains all the schemes recognized by the ONT system.

5. Deployment View

5.1 Global Overview
5.2 Detailed deployment model
